

# CHAPTER 3

## Project Recommendations

## Project Recommendations

The following pages detail the project and route recommendations that were identified using the prioritization criteria outlined in the **Project Approach** section. As noted previously, these projects were put into three tiers to promote flexibility in how and when the projects should be implemented. With multiple agencies and partners able and willing to fund parts of this bicycle and pedestrian network, the tiering system gives these agencies the flexibility to select projects most appropriate for them. Major Projects and Neighborhood Network projects were analyzed separately, and thus are presented separately in this section. There is no specific order in which the routes or projects should be prioritized within the tiers. To ensure that the Network is implemented to maximize overall connectivity, it is recommended that Tier I projects be completed first, followed by Tier II, and finally, Tier III.

These project pages provide information on the proposed projects and routes including project details, length of the project, proposed improvements, special considerations, next steps, and planning level cost estimates. This information is intended to provide an outline for each project, and give the implementing agency sufficient information to move forward into the next phase towards completion. Examples of the project pages with further descriptions of each section of information are shown in **Figure 15 and 16**.

For all identified major projects, the next step includes a feasibility study, which will be necessary to move from project identification towards implementation. A feasibility study is a preliminary technical assessment of the practicality of the proposed route or project. Feasibility studies often include site reconnaissance, desktop environmental assessment, right-of-way evaluation, and the development of alternatives. A feasibility study determines the extent of the Project Development and Environmental (PD&E) study that will be necessary for the project as it moves towards implementation. It is during the PD&E phase that stakeholder and public outreach will occur.

Next steps for neighborhood network routes will require outreach to surrounding neighborhoods, and coordination with Leon County Public Works, City of Tallahassee Underground Utilities, Tallahassee-Leon County Planning Department, the City of Tallahassee, and/or Leon County. In creating additional traffic calming strategies, Tallahassee and Leon County have a specific procedure for implementation. This procedure should be considered and/or modified in the implementation of the neighborhood network.

Additionally, each project or route is associated with facility improvements. The following graphics details each type of facility that is proposed in this Plan.

*Sharrows in Downtown Tallahassee*

### Trail

Paved trail or multi-use path adjacent to the roadway but separated by a landscape buffer.

### Two-way Cycle Track

A physically separated cycle track that allows bi-directional bicycle traffic on one side of the road. (NACTO)

### Separated Bike Lane

A bike lane on the roadway with physical vertical barriers/delineators separating motorists from cyclists.

### Buffered Bike Lane

A bike lane on the roadway with pavement markings and additional width separating motorists and cyclists.

### Designated Bike Lane

A standard bike lane with markings and signage.

### Sharrow

Pavement markings indicating the cyclist's right to utilize the entire roadway.

The following tables (**Figure 17, 18, 19, and 20**) show the breakdown of the routes within the tiering system. Maps of the entire recommended bicycle network, major projects, and neighborhood network are shown in **Figures 21, 22, and 23**. These projects will be described in further detail in the following Project Pages. Cost estimates and ranges are available on the project pages, but are shown in further detail in **Appendix C**
