1. AGENDA MODIFICATIONS

2. CONSENT

A. CRTPA Safety Targets and Performance Measures
CRTPA staff has prepared updated safety targets and performance measures to adopt for the CRTPA area as required by the Federal Highway Administration (FHWA).

Recommended Action: For CMAC recommendation of approval.

B. CMAC 2019 Committee Calendar
Annually, the CRTPA approves a calendar of meetings for the upcoming year. The CRTPA 2019 calendar has been developed for CRTPA approval, and at this time, CRTPA staff is seeking approval of a supporting calendar for committee meetings.

Recommended Action: For CMAC recommendation of approval.

If you have a disability requiring accommodations, please contact the Capital Region Transportation Planning Agency at (850) 891-6800. The telephone number of the Florida Relay TDD Service is #711.
3. **Presentations/Discussion/Action**

A. **Election of CMAC Chair and Vice-Chair**  
   Annually, the CMAC elects a new Chair and Vice-Chair to serve for the upcoming calendar year. There is no restriction on who may serve in either capacity from year to year within the CMAC membership.

   **Recommended Action:** Elect a Chair and Vice-Chair for the 2019 Calendar year.

B. **Tharpe Street and Pensacola Street Operational Analyses**  
   The Draft Traffic and Operations Analysis Reports for Tharpe Street and Pensacola Street have been submitted to the CRTPA for review. At this time, the project consultant, RS&H, will provide a summary presentation of the reports for committee consideration and information.

   **Recommended Action:** For CMAC recommendation of approval.

4. **Open Forum for Public Comment**  
   *Citizens are invited to address the committee.*

5. **Information**

6. **Items from Committee Members or Staff**
STATEMENT OF ISSUE

The purpose of this item is to review the “Safety” Performance Targets for the Capital Region Transportation Planning Area (CRTPA) for the following five (5) safety performance measures adopted by the Federal Highway Administration (FHWA) in 2017 for all public roads:

1. Number of fatalities;
2. Rate of fatalities per 100 Million Vehicle Miles Traveled (VMT);
3. Number of serious injuries;
4. Rate of serious injuries per 100 Million VMT; and
5. Number of non-motorized fatalities and non-motorized serious injuries.

RECOMMENDED ACTION

Option 1. Recommend approval of the recommended Safety Targets.

HISTORY AND ANALYSIS

Nationally, state-specific, and locally, transportation plans exist to enhance safety for all users of the transportation system. A coordinated effort to connect all of the safety plans has long been in effect in the transportation realm, but over the last two years, a system of Performance Management has led to a greater push for comprehensive and coordinated transportation and safety planning.
Performance Measures for Safety were developed by the FHWA, for which targets were established cooperatively between the FDOT and MPO’s within the State of Florida (as well as nationally). The Performance Measures are outlined in Table 1 Below.

### Table 1: FHWA Adopted Safety Performance Measures

<table>
<thead>
<tr>
<th>Performance Measure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of fatalities</td>
<td>The total number of persons suffering fatal injuries in a motor vehicle crash during a calendar year.</td>
</tr>
<tr>
<td>Rate of fatalities per 100 Million Vehicle Miles Traveled (VMT)</td>
<td>The ratio of total number of fatalities to the number of vehicle miles traveled (VMT, in 100 Million VMT) in a calendar year.</td>
</tr>
<tr>
<td>Number of serious injuries</td>
<td>The total number of persons suffering at least one serious injury in a motor vehicle crash during a calendar year.</td>
</tr>
<tr>
<td>Rate of serious injuries per 100 Million VMT</td>
<td>The ratio of total number of serious injuries to the number of VMT (in 100 Million VMT) in a calendar year.</td>
</tr>
<tr>
<td>Number of non-motorized fatalities and non-motorized serious injuries</td>
<td>The combined total number of non-motorized fatalities and non-motorized serious injuries involving a motor vehicle during a calendar year.</td>
</tr>
</tbody>
</table>

In August of 2017, the FDOT adopted a target of “Zero” for the five (5) safety performance measures adopted by the Federal Highway Administration (FHWA) for all public roads. FDOT adopted the same target of, “Zero” again in 2018 (shown in Table 2 below).

### Table 2: 2017 & 2018 FDOT Adopted Safety Targets

<table>
<thead>
<tr>
<th>FDOT Adopted Measures</th>
<th>Target</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of fatalities</td>
<td>0</td>
</tr>
<tr>
<td>Rate of fatalities per 100 Million Vehicle Miles Traveled (VMT)</td>
<td>0</td>
</tr>
<tr>
<td>Number of serious injuries</td>
<td>0</td>
</tr>
<tr>
<td>Rate of serious injuries per 100 Million VMT</td>
<td>0</td>
</tr>
<tr>
<td>Number of non-motorized fatalities and non-motorized serious injuries</td>
<td>0</td>
</tr>
</tbody>
</table>

Upon adoption by the Florida Department of Transportation (FDOT) of a target of “Zero”, the CRTPA, along with all the other Metropolitan Planning Organizations in the State of Florida, were given 180 days to adopt their targets for the safety measures.
2018 CRTPA SAFETY TARGETS

Utilizing data provided to the CRTPA from FDOT and the FHWA, staff established an average result for each performance measure from the years 2012 through 2016. The averages were utilized as the 2018 target and performance measure for each Safety Measure and are shown in Table 3 below. These Safety Performance Measures and Targets were adopted on February 20, 2018.

<table>
<thead>
<tr>
<th>Draft Safety Performance Measures</th>
<th>Target and Performance Measure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of fatalities</td>
<td>56</td>
</tr>
<tr>
<td>Rate of fatalities per 100 Million Vehicle Miles Traveled (VMT)</td>
<td>1.279</td>
</tr>
<tr>
<td>Number of serious injuries</td>
<td>266</td>
</tr>
<tr>
<td>Rate of serious injuries per 100 Million VMT</td>
<td>7.313</td>
</tr>
<tr>
<td>Number of non-motorized fatalities and non-motorized serious injuries</td>
<td>44</td>
</tr>
</tbody>
</table>

RECENT ACTIONS

2019 CRTPA SAFETY TARGETS

Utilizing data provided to the CRTPA early this year from FDOT and the FHWA (provided in Attachment 1), staff established an average result for each performance measure from the years 2013 through 2017. The averages were utilized as the 2019 target and performance measure for each Safety Measure. The resulting recommended measures are shown below in Table 4 and are slightly lower than those adopted in the previous year. A fluctuation up or down is expected as the 4-year average rolls forward due not only to a change in the newly appearing year, but also to the drop of the earliest year’s raw data from the new average.

<table>
<thead>
<tr>
<th>Draft Safety Performance Measures</th>
<th>Target and Performance Measure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of fatalities</td>
<td>54</td>
</tr>
<tr>
<td>Rate of fatalities per 100 Million Vehicle Miles Traveled (VMT)</td>

</table>

Single-county MPO/TPOs that encompass the entire limits of the county are calculated using the total county fatalities, serious injuries and traffic volumes as published. Multiple-county MPO/TPOs that encompass the entire limits of each of their included counties are calculated using the fatalities, serious injuries and traffic volumes summed for all of the included counties and are combined totals and rates calculated based on combined totals and combined traffic volumes. MPO/TPOs that do not encompass whole counties are not calculated at the MPO/TPO level but the county calculations for each included county are presented in the lower table.

DATA SOURCES: Fatal and serious injury counts from Florida Dept of Transportation [FDOT] State Safety Office’s Crash Analysis Reporting (CAR) database as of December 13, 2018; traffic volumes as published by the FDOT office of Transportation Data and Analytics at http://www.fdot.gov/planning/statistics/millage/rpts/
COMMITTEE AGENDA ITEM 2 B

2019 COMMITTEE CALENDAR

TYPE OF ITEM: Committee Action

STATEMENT OF ISSUE

Annually, the CRTPA approves a calendar of meetings for the upcoming year. The CRTPA 2019 calendar has been adopted, and at this time CRTPA staff is seeking approval of a supporting calendar for committee meetings.

RECOMMENDED ACTION

Option 1: Approve the 2019 Committee Meeting Calendar.

COMMITTEE AGENDA ITEM 3 B

THARPE STREET & PENSACOLA STREET OPERATIONAL ANALYSES

TYPE OF ITEM: Discussion & Approval

STATEMENT OF ISSUE

The Draft Traffic and Operations Analysis Reports for Tharpe Street and Pensacola Street have been submitted to the CRTPA for review. At this time, the project consultant, RS&H, would like to provide a summary presentation of the reports for Committee consideration. The Draft Reports have been provided as part of this agenda item.

HISTORY AND ANALYSIS

In February of 2018, the CRTPA directed its general consultant, RS&H, to initiate corridor studies for Tharpe Street and Pensacola Street, both of which are within Leon County. These corridors were identified as needing additional capacity improvements (roadway widening) in the currently adopted 2040 Regional Mobility Plan (RMP). The corridor studies were initiated to identify existing and projected future conditions along the corridor limits for Pensacola Street (Appleyard Drive to Capital Circle SW) and Tharpe Street (Ocala Road to Capital Circle, NW) and to identify potential projects to improve mobility and efficiency without major capacity expansions.

RECENT ACTIONS

The DRAFT Reports for the Tharpe Street and Pensacola Street Corridors have been submitted to the CRTPA for review and consideration in January of 2019. At this time, the consultant for the project is prepared to provide an overview to the CRTPA Committees of the findings for each corridor study, which are briefly outlined on the following pages.
I. **Tharpe Street Corridor Report Summary**

The Tharpe Street Corridor Report identified three distinct sections along the corridor by characteristic. These sections are identified as the *Industrial Section*, the *Residential Section*, and the *Sheridan Road Section*. The limits and roadway characteristics of the three sections are outlined in Table 1 below.

<table>
<thead>
<tr>
<th>Section</th>
<th>Number of Travel Lanes</th>
<th>Lane Width (Feet)</th>
<th>ROW Width (Feet)</th>
</tr>
</thead>
<tbody>
<tr>

<td>76</td>
</tr>
<tr>
<td>Sheridan (Ivan Drive to Devra Drive)</td>
<td>2</td>
<td>12</td>
<td>123</td>
</tr>
</tbody>
</table>

**Physical Deficiencies**

The Tharpe Street Corridor Report identified five (5) main physical issues along the corridor that warrant addressing. These issues are as follows:

1. **Transit Accessibility** - Bus stops are not compliant with Americans With Disabilities Act (ADA), shelters and sidewalks are missing, informational materials about the stops are missing.
2. **Spot Congestion** – Spot congestion occurs as a result of frequent bus stops (including school bussing), and trash collections especially during am peak hours, without the means for traffic to maneuver safely around the congestion/delays.
3. **Lack of Bicycle and Pedestrian Facilities** – 90% of the land parcels along the corridor of Tharpe Street have no bicycle lanes or sidewalks.
4. **Desire Lanes** – “Goat Paths” showing where existing foot traffic is occurring alongside the roadway.
5. **Flooding and Runoff** - Storm water runoff is causing erosion and flooding alongside the existing roadway, further complicating the pedestrian’s quest for safe travel.
Level of Service and Crash Data

The existing intersection analysis of Tharpe Street (summarized below in the table) reveals that the Mission Road intersection is currently operating at a LOS “E”, which is below the adopted LOS standard considered acceptable for the peak hour. Based on this analysis, Capacity Improvements would be warranted.

Table 2. Existing Intersection Operation Analysis.

<tr>
<td>San Luis Rd./Devra Dr.</td>
<td>B</td>
<td>B</td>
</tr>
<tr>
<td>N. Ocala Rd. / Fairlane Rd.</td>
<td>C</td>
<td>D</td>
</tr>
</tbody>
</table>

With regard to crash data, analyses from this report show that the corridor segment (Ocala Road to Capital Circle, SW) has a crash rate of 6.14 compared to the state average of .299.

Recommended Priority of Improvement Types for the Corridor

With Tharpe Street classified as an urban minor arterial, it was recommended that priority be placed on improving/installing the following roadway features:

1. Sidewalks
2. Medians
3. Access management
4. Multimodal intersection design
5. Bicycle lanes
6. Sharrows
7. Bus pullouts
8. Bus shelters
9. Landscaping

Overall Recommendations for the Tharpe Street Corridor by Characteristic Segments

The following recommendations are proposed for the segments of Tharpe Street identified below.

A. Industrial Section Recommendations
   (East of Capital Circle NW to Mission Road)
Committee Agenda Item 3 B – Tharpe Street & Pensacola Street Operational Analyses
February 5, 2019

B. Residential Section Recommendations
(Mission Road to Ivan Drive & Devra Drive to West of Ocala Road)

- Install 5-foot-wide concrete sidewalk with a 4 foot wide utility strip on the north side;
- Add shared lane markings (Sharrows);
- Convert Blountstown Hwy and Tharpe Street to a “T” Intersection;
- Install a Linear Park on Blountstown Hwy; and
- Install an 8-foot-wide concrete sidewalk (curb and gutter) along the east side of Blountstown Hwy.

C. Sheridan Section Recommendations
(Ivan Drive to Devra Drive)

- Add 8-foot-wide concrete sidewalk, culvert system, and curb & gutter along north side of Tharpe Street;
- Add 8-foot-wide pedestrian bridge over central drainage system;
- Widen 10 feet along the south side of Tharpe Street for addition of medians;
- Add two Jug handle U turns;
- Install turnout bay; and
- Re-stripe east side of Tharpe Street near Ocala Road to include bike lanes.
II. PENSACOLA STREET CORRIDOR REPORT SUMMARY

**Physical Deficiencies**

The Pensacola Street Corridor Report identified four (4) main physical issues along the corridor that were identified and studied. These issues are as follows:

1. **Spot Congestion** – Spot congestion occurs as uniform dismissal from classes at Tallahassee Community College (TCC) spike traffic as students and faculty begin to exit the TCC parking lot.

2. **Lighting** – A review of the crash history along the Pensacola corridor was conducted in order to identify deficiencies with respect to existing lighting infrastructure. An analysis of data pulled from 2012-2016 revealed that 17 out of 160 crashes occurred during low visibility hours (dusk, dawn, and nighttime). These incidents comprised 9.4% of total crashes. Additionally, referencing the associated long-form crash reports for these events, none cited low visibility as a primary cause. Therefore, no improvements to existing lighting infrastructure are recommended at this time.

3. **Bottleneck** - Recent road widening has developed the section of Pensacola Street from Capital Circle SW to Blountstown Hwy as a 6-lane section, but as Pensacola Street continues east, it condenses into a 2-lane section at the bridge, creating a bottleneck. Pensacola Street continues as this 2-lane roadway transitioning to a 4-lane roadway at TCC’s access point. Increased east bound traffic volumes are likely to occur due to the increased capacity of the 6-lane section of Pensacola Street. The increases in traffic volumes could intensify congestion along Pensacola Street. For this reason, the existing bottleneck is a candidate for remediation.

4. **Lack of Bicycle and Pedestrian Facilities** – Currently, the 2-lane section between Blountstown Hwy and Progress Drive lacks bike and pedestrian facilities. For this reason, cyclists and pedestrians are given no choice but to travel along grassed areas to avoid interaction with motorists. However, grassed ditches are not always made available. The bridge located in this section poses a high-risk area for pedestrians as they are given no choice but to travel on the roadway with vehicular traffic.

**Level of Service and Crash Data**

The existing intersection analysis is summarized in Table 2, on the following page, which reveals that under current conditions, all major intersections appear to be operating at acceptable LOS values for peak hour operations. Based on this analysis, there appears to be no need for major capacity improvements along the Pensacola Street Corridor.
Review of the Annual Average Daily Traffic (AADT) from FDOT revealed that the highest volumes of traffic for the Pensacola Corridor under study appear to be east of Appleyard Drive and west of Blountstown Hwy.

With regard to crash data, analyses from this report show that TCC’s current access point on Pensacola Street reported the highest segmental crash rate. Accordingly, the intersection of Appleyard Drive and Pensacola Street experience the highest *intersection* crash rate within the study area of 1.74 per million vehicle miles of travel (MVMT).

### Overall Recommendations for the Pensacola Street Corridor

**A. Bottleneck - Widening Alternative of Bridge**

- Widen Bridge adding two lanes (12' in width) and two 5-foot sidewalks for a total of 34’ in widening (According to FDOT's Transportation Cost Reports (2014), the cost of construction for bridge widening falls between $85 and $160 per square foot. To be conservative, the value of $160 per square foot is applied. The bridge in question is approximately 285.1' in length (according to FDOT SLD). Using the bridge’s length and the total widening width, approximately 9693.4 square feet would be added to the existing structure at a cost of $1,550,944); and

- Widen Pensacola Street at the approach tapers to make the roadway compatible with the widened bridge deck. (According to FDOT's LRE models "Adding 2 Lanes to Existing 3 Lane Undivided Arterial (1 Lane Each Side) with Center Turn Lane and 4' Bike Lanes" (in an urban setting) is approx. $4,732,174.28 per mile. The length of roadway in question is approximately 0.634 miles in length resulting in a cost estimate of $3,000,198.50).

*NOTE: The combined/total cost estimate of widening Pensacola St. to 4 lanes and the accompanying bridge is $4,551,142.50. However, this cost does not incorporate closing down and/or altering the CSX lines to facilitate said widening.*
B. Spot Congestion - Low Cost Alternative
   - Add a “Private Drive, No U-Turn” sign to entrance(s) of Disc Village, Grainger, and/or Pepsico.

C. Spot Congestion - Comprehensive Alternative
   - Reconfigure access points to TCC from Pensacola.
     - Creating a dedicated two lane entrance for TCC -- restriped to create both a left turn and right through lane;
     - Add a two-lane dedicated exit -- southwest of the Social Science Wing of TCC; and
     - Add “Do Not Enter” signs at the heads of the one-way pair to alert drivers.
   - Manage access and restrict illegal movements at the existing two-way access point at TCC near the intersection at Appleyard Dr.

Tharpe Street

BACKGROUND

The Capital Region Transportation Planning Agency (CRTPA) identified the need for additional capacity along Tharpe Street in the 2040 Regional Mobility Plan (RMP). The RMP proposes the widening of this corridor from Ocala Road to Capital Circle Northwest from two lanes to four lanes. The purpose of this study is to investigate existing conditions along Tharpe Street and identify potential projects to improve mobility and efficiency without major capacity expansions.

Existing conditions were established using the following data sources:

Table 1. List of Data Collection Sources

</tbody>
</table>

The corridor exhibits three distinct sections based on character and land use. These sections are identified as the Industrial Section, the Residential Section, and the Sheridan Road Section (see Figure 1). The Residential Section is divided into two sections: Mission Road to Ivan Drive and Devra Drive to west of Ocala Road. Number of lanes, travel lanes widths, and right-of-way (ROW) widths are shown in Table 2. The review of the existing conditions within the corridor resulted in the identification of five major issues and are discussed in the following sections.

Figure 1. Project Overview
ISSUES

Issue #1 – Transit Accessibility

StarMetro serves as the public transit agency for the City of Tallahassee and Florida State University. Currently, bus stops along Tharpe Street are not compliant with the Americans with Disabilities Act (ADA) and offer limited information to passengers (see Figure 2). Current ADA compliance is only required when bus shelters and sidewalks already exist. StarMetro desires to make all public transit links adhere to current ADA standards and to provide schedule and route information, making the system more accessible and safer for all riders.

Figure 2. Typical Bus Stop Along Tharpe Street
**Issue #2 – Spot Congestion**

Spot congestion along Tharpe Street is primarily caused by routine traffic events such as bus pick up/drop off, trash collections, and left turn traffic. Some portions of the corridor have one through lane in each direction that is separated by a dual left turn lane (see Figure 3). Left turn traffic is especially common in the residential section of Tharpe Street where minor streets are clustered together. During routine bus stops, motorists often travel over painted medians due to the lack of maneuvering space provided by the current two-lane design as shown in Figure 4. With these left turn movements, spot congestion is especially prevalent in the residential section of Tharpe Street during peak AM/PM hours.

*Figure 3. Existing Lane Design*

*Source: Florida Driver Handbook*
Figure 4. Lack of Maneuvering Space Along Tharpe
Issue #3 – Lack of Bicycle/Pedestrian Facilities

Presently 90% of the land parcels along Tharpe Street have no access to sidewalks or bicycle facilities. For this reason, cyclists and pedestrians have no choice but to travel along grassed ditches to avoid interaction with motorists (see Figure 5). However, grassed ditches are not always made available. One area in particular, located 500 feet east of Trimble Road, poses a high-risk area for pedestrians as they are given no choice but to travel on the roadway with vehicular traffic (see Figure 6).

Figure 5. Pedestrian Travel Pattern
Figure 6. High Risk Area for Pedestrians
**Issue #4 – Desire Lanes**

Desire lanes are paths that result from on-going pedestrian foot traffic and can be found at multiple locations along Tharpe Street. This not only lacks pedestrian safety benefits but also uniformity throughout the corridor. Prevalence of desire lanes signify the need for sidewalks (see Figure 7).

*Cite source:*

**Figure 7. Desire Lanes along Tharpe Street**
Issue #5 – Flooding and Runoff

Evidence of roadside erosion can be observed throughout the corridor. Existing conditions show roadway drainage traveling to nearby roadside ditches that transports water runoff to the nearest outfall point (see Figure 8). Presently, no stormwater treatment is provided for the roadway other than the flow time in grassed ditches.

Figure 8. Slope Erosion Caused by Stormwater Runoff along Tharpe Street
ANALYSIS

Analysis Procedures

Analysis of traffic volumes is useful in understanding the general nature of traffic in an area, however, the volumes alone do not indicate the ability of the street network to carry additional traffic or the quality of service afforded by the street facilities. To fully understand the operations of the facility, Level of Service (LOS) is utilized to describe traffic performance. LOS can be measured at intersections and along key roadway segments. LOS categories are similar to report card ratings for traffic performance. LOS A, B and C indicate conditions where traffic moves without significant delays over periods of peak travel demand. LOS D and E are progressively worse operating conditions and LOS F conditions represent gridlock where demand exceeds the capacity of an intersection or roadway segment.

Operational analysis for Tharpe Street was performed following the Highway Capacity Manual (HCM) 2000 methodologies using Synchro software. This was made available by The City of Tallahassee and reflects AM/PM traffic operations during October 2017.

Historical and county traffic sites provided the source of existing traffic for the Tharpe Street study area. Existing intersection analysis is summarized in Table 3 and shown in Figure 9. Under current conditions, the Mission Road intersection is not operating at an acceptable LOS for the peak hour. Mission Road operates at LOS E under existing traffic conditions, which does not meet established standards and identifies the need for capacity improvements.

Crash Rates

Crash rates are calculated values used in the comparison of crash experience of similar locations in the region. State agencies typically develop average crash rates for different types of intersections and roadway segment for statewide analyses. Incorporating crash rate with roadway information, such as traffic volume, aid in identifying roadway deficiencies.

Crash data was obtained from the recently updated Congestion Management Plan update. Sourced data encompassed the five-year period from 2012 to 2016. Crash data were then analyzed to determine types and locations of crashes that occurred along the corridor and at intersecting roadways. A total of 709 crashes were reported between 2012 to 2016. Of these, 333 were injury crashes, while only one reported fatality. Rear-end collisions were reported as the most common crash type in the residential section accounting for 50% total accidents. This number of rear-end collisions is likely due to driver response with the frequent spot congestion and left turning movements during AM/PM peak hours.

Currently Tharpe Street within the analysis segment has a crash rate of 6.14 per million vehicle miles of travel (MVMT). The state average for similar facilities consisting of undivided, two to three lanes with two-way traffic is 0.299.

RECOMMENDATIONS

The Street Design Priority Matrix, shown in Figure 10, is a tool used in the development of the Connections 2040 Regional Mobility Plan. This tool provides an understanding of the transportation facility elements and features and the connection to complete street components. The tool identifies priority features for different roadway classifications based on the overall character area. With Tharpe Street classified as an urban minor arterial, priority was placed on improving/installing the following roadway features:

1. Sidewalks
2. Medians
3. Access management
4. Multimodal intersection design
5. Bicycle lanes
6. Sharrows
7. Bus pullouts
8. Bus shelters
9. Landscaping

**Industrial Section Recommendations**

Proposed recommendations for the Industrial section of Tharpe Street:

- Install 5-foot wide concrete sidewalk with a 4-foot wide utility strip on the north side.
- Addition of shared lane markings (Sharrows).
- Conversion of Blountstown Hwy and Tharpe Street to a “T” intersection.
- Install 8-foot wide concrete sidewalk and curb and gutter along east side of Blountstown Hwy.

Figure 11 displays the recommended conversion of the Blountstown Highway and Tharpe Street intersection.
Figure 11. Blountstown Highway and Tharpe Street Intersection
Residential Section Recommendations

Proposed for the Residential section of Tharpe Street:

• Addition of 8-foot wide concrete sidewalk, culvert system, and curb and gutter along north side of Tharpe Street.
• Addition of 8-foot wide pedestrian bridge over central drainage system.
• Widen 10 feet along the south side of Tharpe Street for addition of medians from Mission Road to Trimble Road.
• Addition of two Jug handle U turns allowing U-turn for vehicles needing left turn access
• Install turnout bays.
• Re-striping east side of Tharpe Street near Ocala Road to include bike lane.

Figures 12 through 16 display the recommendations identified for this section.
Figure 12. Mission Road at Tharpe Street

Figure 15. Pedestrian Bridge
Figure 16. Valley Green Drive to Meriadoc Drive
**Sheridan Section Recommendations**

- Addition of 8-foot wide concrete sidewalk, culvert system, and curb and gutter along north side of Tharpe Street.

Figures 17 and 18 display the Ivan Drive and Devra Drive areas.
Figure 17. Ivan Drive
Summary of Recommendations

Restricting allowed turning movements on the residential segments between Mission and Trimble Road may benefit traffic operations with the use of restrictive medians. By limiting the number of allowed turning movements, this segment would experience reduced crashes caused by crossover traffic from minor streets along the residential segment. Medians would eliminate spot congestion in the area by removing traffic events that block through movements. As a result, this would improve operational efficiency. Addressing the issue of congestion would have the added benefit of eliminating the need for additional lanes. Furthermore, medians provide a refuge for pedestrian crossing Tharpe Street allowing them to be more visible to drivers, hence improving pedestrian safety.

In addition to safety and operations benefits, medians would improve the appearance of Tharpe Street. With a more unified street design a better sense of community is to be expected. Further details including supporting data, project limits, pros and cons for proposed recommendations can be found in Table 5 and Table 6.

Pensacola Street

BACKGROUND

The Capital Region Transportation Planning Agency (CRTPA) identified the need for additional capacity for Pensacola Street in the 2040 Regional Mobility Plan (RMP). The RMP proposes the widening of this corridor. The purpose of this study is to investigate existing and future conditions along Pensacola Street (SR 366) and identify potential projects to improve mobility and efficiency without major capacity expansions. This study will identify potential improvements from Appleyard Drive to Capital Circle (see Figure 1). Existing conditions were established using the following data sources listed in Table 1 below:

ISSUES

Issue # 1 - Spot Congestion

Field observations report uniform dismissal from classes at Tallahassee Community College (TCC) as the primary cause of congestion along the corridor. The result is a short-term spike in traffic as students and faculty begin to exit the TCC parking lot. As congestion worsens internally, motorists tend to follow a “path of least resistance” strategy in order to exit the campus.

Figure 2 illustrates typical congestion conditions from high (red) to low (yellow). Field observations report drivers located in the southeast – Learning Commons - parking lot egress exit to the south onto Pensacola Street. Left turn movements are restricted at this location due to its proximity to the intersection at West Pensacola Street and Appleyard Drive. Despite left turn restrictions, motorists often make illegal left turns, crossing double yellow lane lines in U-turn maneuvers, utilizing private driveways to turn around. These traffic patterns exacerbate spot congestion during AM/PM peak hours.

Figure 2. Typical Congestion from TCC Campus
Issue # 2 - Bottleneck

When a road has limited physical capacity (i.e., bottlenecks), it contributes to recurring congestion according to the Federal Highway Administration (FHWA). Recent road widening has developed the section of Pensacola Street from Capital Circle SW to Blountstown Highway as a six-lane section. As Pensacola Street continues east, it narrows to a two-lane section at the bridge over the railroad, shown in Figure 3, consequently creating a bottleneck. Pensacola Street continues as a two-lane roadway transitioning into a four-lane roadway at TCC’s access point.

Increased traffic volumes, an effect from the recent widening of Pensacola, will not only further exacerbate the bottleneck situation but also the spot congestion identified near the TCC campus.

Figure 3. Bottleneck along Pensacola Street
**Issue # 3 - Lack of Bicycle/Pedestrian Facilities**

Currently, the two-lane section between Blountstown Highway and Progress Drive lacks bicycle and pedestrian facilities (see Figure 4). For this reason, bicyclists and pedestrians are given no choice but to travel along grassed areas to avoid interaction with motorists. However, grassed shoulders and/or ditches are not present throughout the corridor, particularly at the bridge. The lack of facilities and shoulder refuge in this area poses a high risk area for pedestrians as they are given no choice but to travel on the roadway with vehicular traffic.

*Figure 4. Lack of Bicycle/Pedestrian Facilities Along Pensacola Street*
ANALYSIS

Analysis Procedures

Analysis of traffic volumes is useful in understanding the general nature of traffic in an area, but by itself indicates neither the ability of the street network to carry additional traffic nor the quality of service afforded by the street facilities. To fully understand the operational capabilities of the roadway, the concept of level of service (LOS) has been applied to describe traffic performance. LOS can be measured at intersections, as well as on roadway segments.

LOS categories are similar to report card ratings for traffic performance. LOS A, B and C indicate conditions where traffic moves without significant delays over periods of peak travel demand. LOS D and E are progressively worse peak hour operating conditions and LOS F conditions represent gridlock where demand exceeds the capacity of an intersection or roadway segment. FDOT sets level of service D as the minimum acceptable level of service for peak hour operation and plans for level of service C or better for all other times of the day.

Historical traffic data and county traffic sites provided the source of existing traffic for the Pensacola Street study area. Figure 5 summarizes Annual Average Daily Traffic (AADT) from the Florida Department of Transportation traffic information. The highest traffic volumes within the study segment in 2016 are found between Blountstown Highway and Capital Circle SW, with an Average Annual Daily Traffic (AADT) of 18,300. The traffic information is displayed in Figure 5.

Operational analysis for Pensacola Street was performed following the Highway Capacity Manual (HCM) 2000 methodologies using Synchro software. This was made available by the City of Tallahassee and reflects AM/PM traffic operations during October 2017. Existing intersection analysis is summarized in Table 2. Under current conditions, all major intersections appear to be operating at acceptable LOS values for peak hour operations.

Table 2. Existing Intersection Operation Analysis.
Figure 5. 2016 Traffic Volumes
Crash Rates

Crash rates are calculated values used to compare the crash experience of similar locations and normalize the crash data over the period of time to account for any large data anomalies. The Florida Department of Transportation develops average crash rates for intersections and for roadway segments and provide insight into identifying any safety deficiencies.

The crash data for this assessment was obtained from the recently updated Congestion Management Plan. The data period is five years from 2012 to 2016. The data was analyzed to determine the types and locations of crashes that occurred along the corridor and at intersections within the study segment.

TCC’s current access point (see Figure 6) reported the highest segmental crash rate of 1.96 per million vehicle miles of travel (MVMT). The access point is also adjacent to the intersection of Appleyard Drive and Pensacola Street, an area that experiences the highest intersection crash rate within the study area at 1.74 MVMT. The state average for similar facilities consisting of undivided, two to three lanes with two-way traffic is 0.2999. Table 3 summarizes comparison results for Pensacola Street and Florida’s state average.

<table>
<thead>
<tr>
<th>Table 3. Pensacola Street Crash Rate vs. State Average</th>

</thead>
<tbody>
<tr>
<td><strong>Pensacola Street</strong></td>
</tr>
<tr>
<td>Crash Rate (MVMT)</td>
</tr>
</tbody>
</table>

*Source*: Florida’s five year average crash rate for 2-3 lane, 2 way, undivided roadway section.

The crash history along the Pensacola corridor was also assessed to identify deficiencies with respect to existing lighting infrastructure. The analysis of crash data revealed that 17 out of 160 crashes occurred during low visibility hours (dusk, dawn, and nighttime). These incidents comprised 9.4% of total crashes. Additionally, referencing the associated long-form crash reports for these events, none cited low visibility as a primary cause, therefore, no improvements to existing lighting infrastructure are recommended at this time.
Figure 6. Highest Reported Crash Rate Along Pensacola Street
**Congestion Analysis Scan Results**

The Federal Highway Administration maintains a database of travel information gathered from cellular and GPS units. This database, the National Performance Monitoring Research Data Set (NPMRDS) provides the information for use in network and corridor analyses. The data serves as one analysis tool and can provide insights into the operations of facilities, however, to comprehensively understand the operations of a facility, this data must be combined with other data sources, however if can provide some indication of existing issues.

According to the NPMRDS data, the westbound congestion analysis reports average travel speed between Appleyard Drive and Blountstown Hwy as 20 miles-per-hour (mph) between the AM/PM peak hours (see Figure 7). This is significantly lower than the current posted speed limit of 45 mph and similar results are reported for eastbound traffic. Figure 8 is the NPMRDS scan of the segment and graphically displays the generalized travel speed along Pensacola Street from east of Appleyard Drive to Capital Circle SW.

![Figure 7. Generalized AM/PM Peak Hour Travel Speeds](image-url)

Averaged by 1 hour for February 02, 2017 through December 31, 2017
RECOMMENDATIONS

Bottleneck and Pedestrian/Bicycle Safety

In order to address the bottleneck existing at the bridge over the railroad, the bridge and the remaining two-lane section of Pensacola Street should be widened. This widening to four lanes should also incorporate bicycle and pedestrian facilities to address safety concerns for pedestrians and bicyclists on the current bridge. Coordination with CSX railroad will need to be undertaken to facilitate the widening.

Spot Congestion – “Quick Fix”

As a quick fix and low cost improvement to address one of the identified “work around” traffic movements resulting from the spot congestion at TCC, the addition of signage may deter a portion of motorists making the movement. With the consent of all parties, a “Private Drive, No U-Turn” sign is proposed to be placed at the entrances of Disc Village, Grainger, and Pepsico. Figure 9 displays the signage and locations.
Figure 9. Private Drive Signage and Locations
Spot Congestion - Comprehensive Alternative

A more comprehensive solution to the issues described regarding spot congestion involves reconfiguring the points of access to TCC from Pensacola. The first element of the proposed approach involves creating a dedicated two-lane entrance for TCC. The entrance will be restriped to create both a left turn and right through lane.

A second element involves the addition of a two-lane dedicated exit -- southwest of the Social Science Wing of TCC (see Figure 10). Locating this access further upstream from the Pensacola/Appleyard intersection allows motorists to safely make left turns eastward without affecting the queue and increasing the site distance of oncoming traffic. Minor striping changes, depicted below, will need to take place in order to guide motorists in a seamless fashion. Additionally, “Do Not Enter” signs will be warranted at the heads of the one-way pair to alert drivers who may be unaware of the scheme.

As described earlier, the highest incidence of crashes occurs at the existing two-way access point near the intersection at Appleyard Dr. Managing access and reducing illegal movements will contribute to improved safety conditions along the corridor.

Figure 10. Spot Congestion – Comprehensive Alternative

Traffic Flow

TCC’s Social Science Wing

1. Dedicated two lane entrance

2. Dedicated two lane exit
Summary of Recommendations

In order to address the issues identified in the analysis, the following recommendations have been identified.

- Widen the existing two-lane section of Pensacola and the bridge spanning the CSX railroad
- Include pedestrian and bicycle facilities in the widening project
- Addition of signage at three locations along Pensacola Street to address illegal and/or dangerous traffic movements by drivers attempting to avoid spot congestion issues
- Reconfigure the ingress/egress access from Pensacola Street to the TCC parking lots
